# TD 5

Java Persistent API

What Done

Follow all steps of tutorial.

What Working

What Not Working

ERROR org.dbunit.database.DatabaseDataSet - Table 'USER' not found

How it works

Based on annotations in User class, the JPA framework know how to create an object for Create-Read –Update –Delete in databases.

persistence.xml helps to configure the connection to the database.

UserTest.java uses Junit framework to test CRUD of the User object.
